1.)

a) Find power factor of load as seen by the source. Include whether leading/lagging

$$Z_{L} = G + 4 / / - j2$$

= $G + \frac{-j8}{4-j2}$
= $G \cdot g - j \cdot I \cdot G$
So $I_{s} = \frac{V_{s}}{Z_{L}} = \frac{30 V_{RMS}}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$
= $\frac{100}{6.8 - j \cdot 6} = 4.29 \angle 13.2^{\circ} A_{RMS}$

b) Find apparent power delivered by source. Include units.

$$S = V_{RMS} \cdot I_{RMS}$$

= (30 V_{RMS})(4.29 A_{RMS})
$$[= 129 VA]$$

c) Find average power delivered by source. Include units.

$$P_{ave} = S \cdot pf$$

= (129)(0.973)
= 125W
